ICE MACHINE INSTALLATION INSTRUCTIONS

Installation of Water Filter Kit

- 1) Screw brass fittings supplied into threaded holes on filter head using P.T.F.E. tape, and tighten.
- 2) Secure filter head to wall.
- 3) Fit 750mm long hose to brass fitting on inlet side of filter head.
- 4) Connect other end of this hose onto the water supply stop valve.
- 5) Connect hose supplied with ice machine to brass fitting on outlet side of filter head.
- 6) Remove protective wrapper from filter cartridge, remove and discard plastic shield from top of cartridge.
- 7) Insert cartridge into head by pushing up and turn until it locks into place.
- 8) The filter now needs to be activated:
 - Place free end of hose connected on outlet into a bucket or similar.
 - Turn on water supply and allow at least 15 litres of water to run through the filter system.
 - Turn off water supply and connect hose to ice machine.
 - Turn on water supply; machine and filter are now ready for use.

Note: Filter cartridge will require replacing in approximately 6 months on average quality water. In hard/poor quality water areas, this may be sooner.
